Improving Disaggregated System Evaluation with Modular End-to-End Simulation

Bin Gao, Hejing Li, Jialin Li, Antoine Kaufmann

Why is disaggregated systems research often hard to evaluate?

Challenge 1: Radical Hardware Changes

Hardware testbeds are often not available

 Memory Disaggregation

 LegoOS [OSDI'18], Clio [ASPLOS'22], MIND [SOSP'21], ...

 I/O Devices
 NetDIMM [MICRO'19], NanoPU [OSDI'21], ...

LegoOS [OSDI'18]

Challenge 2: Component Interactions

Disaggregated systems add more components to critical path with complex interactions.

Full system / end-to-end measurements are essential

Challenge 3: Increased System Scale

Disaggregated systems by design require larger scale

Typical minimal disaggregated system size: 1 — N racks

How do we evaluate disaggregated systems research?

Approach 1: Emulation

Pros:

	Accurate	Flexible	Scalable
Emulation	:-(:-)	:-)

- •Flexible
 - Just need to implement an emulator
- •Typically reasonably fast & scalable

Cons:

- Limited performance accuracy
 - Emulation matches functionality but not performance

Approach 2: Component Simulation

Pros:

- Flexible
 - Implement/modify an appropriate simulator
- Portable & reproducible
 - Many simulators are deterministic

Cons:

- No full system end-to-end performance results
- Simulations (often) take a long time to run

	Accurate	Flexible	Scalable
Emulation	:-(:-)	:-)
Component Simulation	:-(:-)	:-(

Approach 3: Full System Simulation

Pros:

- Accurate end-to-end results
 - As long as the simulator is good
- Portable & reproducible

Cons:

Accurate Flexible Scalable Emulation :-(:-) :-) :-(Component :-) :-(Simulation :-) Full System :-/ :-(Simulation

- Significant effort for development and validation
 - Typically one-off modifications of some existing simulator
- Not scalable and very slow

How can we make end-to-end simulations easier?

. .

.

Modularity is Key

Starting point: SimBricks

- Modular simulation framework
 - Combine & connect multiple different simulators for individual components
- Built for end-to-end network system simulation
- Scales to 1000s of components
- Reproduces performance results from prior research work

SimBricks: End-to-End Network System Evaluation with Modular Simulation Hejing Li, Jialin Li, Antoine Kaufmann. In ACM SIGCOMM 2022.

Extending SimBricks for Disaggregated Systems

- Add missing components
 - Already supported: Host, device, network
 - Need: Remote memory controller, network attached memory/accelerator/...
- Add missing interconnect
 - Already supported: PCIe, Ethernet
 - Need: Memory bus

 corresponding adapters in host simulators

How to use our framework to simulate a disaggregated system?

- Choose the appropriate existing component simulators
 - Processor: gem5, Qemu, ...
 - Network: ns-3, Tofino, ...
 - Device and hardware: Verilator, NIC models, ...
- Optional: for new simulators and hardware designs, implement adapters that connect to SimBricks interfaces
 - PCle, Ethernet, memory bus, ...
- Write (python) configuration script that
 - Instantiates and connects all components
 - Sets simulation parameters
- Run simulation

Case Studies

- Network-attached Disaggregated Memory
 - LegoOS [OSDI '18]
- In-network Disaggregated Memory Management
 - MIND [OSDI '21]

Example 1: Network-attached Disaggregated Memory

Example 1: Network-attached Disaggregated Memory

Example 2: In-network Support for Disaggregation

MIND [SOSP'21].

Example 2: In-network Support for Disaggregation

Example 2: In-network Support for Disaggregation

CPU **Host Simulator:** Memory **Preliminary Results** gem5 Memory **Benchmark: Sysbench Memory** Hardware Simulator: **Memory NIC Nodes:** 3 compute, 2 memory Ethernet Simulation time: ~ 78min **Network Simulator: Tofino** Mem Ethernet **Nodes:** 20 compute, 5 memory **Disaggregated Memory Simulator 1 Disaggregated Memory Simulator 0** Simulation time: ~ 112min Mem Ctl. Mem Ctl. In-network translation for disaggregated memory in *SimBricks*

Future Directions

- Parallelize component simulators through decomposition
 - Use SimBricks techniques to connect and synchronize pieces
- Hardware accelerated simulation
 - Starting by integrating FireSim
- Validation through composition
 - Are modular combinations of individually validated component simulators valid?
- Implementation:
 - Interfaces: CXL / Cache-Coherent memory interface
 - RDMA NIC Simulator

Conclusion

SimBricks can enable full system evaluation for disaggregated systems

• Even with radical hardware changes

https://simbricks.github.io

- (Including simulating RTL with performance beyond FPGAs)
- Scales to simulate 100s-1000s of nodes

Preliminary work, please reach out if you are interested!
